## Mathematics and Information, Exercise sheet 9

Problem 1: (7 points)
a) Some collection contains six documents, in which the following words occur:
$\mathrm{D}_{1}$ : Shannon, Entropy, Information
$\mathrm{D}_{2}$ : Boltzmann, Entropy, Clausius, Heat
$\mathrm{D}_{3}$ : Information, Shannon, Code, Cryptanalysis, Key
$\mathrm{D}_{4}$ : Kelly. Shannon, Bet, Portfolio, Information
$\mathrm{D}_{5}$ : Las Vegas, Shannon, Kelly
D6: Shannon, Juggling, Roboter, Unicycle
Construct a term-document-matrix for this collection in which all column vectors have length one!
b) Code the query Information Shannon by a unit vector and compute the cosine of the angle between this vector and each of the six document vectors!

Problem 2: (6 points)
a) Let $\left(t_{i}, x_{i}\right), i=1, \ldots, 100$ be data points for which a relation of the form $x_{i}=a \sin t_{i}+$ $b \sin 2 t_{i}+c \sin 3 t_{i}+d \sin 4 t_{i}$ is supposed to hold. Which system of linear equations gives the best values for the coefficients $a, b, c, d$ in the sense of least squares?
b) How can you proceed if a connection of the form $x_{i}=a \cos \left(t_{i}+c\right)$ with unknown parameters $a, c$ is suspected?

Problem 3: (7 points)
Determine parameters $a, b, c \in \mathbb{R}$ such that the relation $z=a+b x+c y$ holds approximately for the following points $P_{i}=(x, y, z) \in \mathbb{R}^{3}$ :
$P_{1}=(1,1,1), \quad P_{2}=(1,2,3), \quad P_{3}=(1,3,2), \quad P_{4}=(2,3,4), \quad P_{5}=(0,4,5), \quad P_{6}=(1,-1,3)$
